MusicWave Ultra Speaker Cable

(Printer Friendly Version)

Use MusicWave Ultra with accurate speakers that have well damped enclosures to appreciate fully its resolution throughout the frequency spectrum and its power carrying capability. To capture the fully-resolving capabilities of an Ultra-based system, ask your retailer to help you with speaker placement and room treatments. With the extra attention paid to network components, positioning and construction, and the tighter parts tolerances, MusicWave Ultra brings you that much closer to the music than MusicWave Super.

MusicWave Ultra is available in high quality banana, spade or special-order termination. It is also available as a biwire cable with two sets of speaker cable tails on the speaker end of each channel.

As you go up the scale of performance within Transparent's range, each increase in level means higher quality parts, more exacting placement of the components in the network, and more testing during assembly. As a result, MusicWave Ultra has higher quality network components and more exact parts locations, to transfer bass frequencies more accurately and reject more noise than MusicWave Super. With the MM2 updates, the new Ultra has less noise, more musical impact, more expansive listening space, and greater low-level resolution than the previous generation of Ultra.

Read more about the exciting achievements of [MM2 Technology](#), and how it enhances the performance every audio cable in our range.
